Q1 i) convert L.E.E into a system of 2<sup>nd</sup> order linear differential equations begin with L.E.E.

$$\frac{d}{dg} \left( g^2 \frac{d\sigma}{dg} \right) = -g^2 \sigma^n$$

make substitution  $U = \frac{d\sigma}{dg}$

each mult

$$\frac{d}{dg} (g^2 U) = -g^2 \sigma^n = 2gU + g^2 U'$$

$$\text{So } U' = -\frac{2}{g} U - \sigma^n$$

ii) find inner boundary condition needed for integration. i.e

$$\lim_{g \rightarrow 0} \frac{d^2 \theta(g)}{dg^2} = \dots \text{ well, } \frac{d^2 \theta(g)}{dg^2} \Rightarrow -\frac{2}{g} U - \sigma^n$$

Use l'Hopital's rule where

$$\lim_{x \rightarrow a} \frac{f(x)}{h(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{h'(x)} \quad \text{So,}$$

$$\lim_{g \rightarrow 0} \left( -\frac{2}{g} U - \sigma^n \right) = \lim_{g \rightarrow 0} \left( \frac{-2U - g\sigma^n}{g} \right) = \lim_{g \rightarrow 0} U'$$

$$\text{where } f(g) = -2U - g\sigma^n, \quad g(g) = g,$$

so

$$f'(g) = -2U' - \left( \sigma^n + g \frac{d\sigma^n}{dg} \right) \quad g'(g) = 1$$

Q7) now that we have the central temperature, pressure and density we can get the central temperature from the ideal gas law,

$$P_c = \frac{k_B T_c \rho_c}{\mu m_H} \Rightarrow T_c = 2.01 \times 10^7 \text{ K.}$$

The radius of the star,

$$R = \alpha E_1 = 2.61 \times 10^{10} \text{ cm.}$$

Q16) The actual values of the sun is,

$$R_\odot = 7 \times 10^{10} \text{ cm.}$$

$$T_c = 1.5 \times 10^7 \text{ K.}$$

$$P_c = 2.65 \times 10^{17} \text{ barye,}$$

We are within the order of magnitude to the actual results which is good, reasons for some of these discrepancies might be the simplistic nature of the model, i.e. we don't take into consideration the radiation pressure in the EOS. We also do not take into account energy generation that contributes to holding up the star, which would increase (or should increase) the size of our model. Finally the last but not the least possible reason would be that we are using a simple polytropic model with constant  $n$ , real stars are not polytropes and perhaps the model that yielded the solar quantities takes ~~into account~~ this into account. i.e. it uses a more complex model with varying  $n$  values ect, I wouldn't really know.

2mm Ad

Q2c) Lets first calculate the reduced mass.

$$X_H = 0.715, \quad X_{He} = 0.271, \quad X_n = 1 - X_H - X_{He} = 0.014,$$

$$\text{So } \mu_I^{-1} = \sum \frac{X_i}{A_i m_u} = \frac{1}{m_u} \left( \frac{0.715}{1} + \frac{0.271}{4} + \frac{0.014}{14} \right)$$

$$\mu_E^{-1} = \frac{1}{m_u} (0.715 + \frac{1}{2} \cdot 0.271 + \frac{1}{2} \cdot 0.014) = 1.165$$

$$\Rightarrow \mu_I = 1.28. \quad \text{So } \mu = (\mu_I^{-1} + \mu_E^{-1})^{-1} = 0.61.$$

from before we get  $\xi_1 = 3.65$ ,  $\frac{d\sigma}{ds}|_{\xi_1} = -0.204$ .

$$\text{Such that } \alpha = 6.24 \times 10^{10}, \quad \mu = 2.37 \times 10^{15}$$

and,

$$R = \alpha \xi_1 = 2.28 \times 10^{11} \text{ cm}, \quad \rho_c = 4.7 \times 10^{16} \text{ g cm}^{-3} \text{ barye}$$

In order to get the central temperature of the star one needs to consider the EOS

$$P = P_{\text{gas}} + P_{\text{rad}} = \frac{k_B T \rho}{\mu m_u} + \frac{a}{3} T^4$$

so

$$\rho_c = \frac{k_B T_c \rho}{\mu m_u} + \frac{a}{3} T_c^4 \Rightarrow 4.7 \times 10^{16} = 3.9 \times 10^8 T + 2.5 \times 10^{18} T_c^4$$

Using a solver I get. (from wolfram mathematica)

I used  $\mu = \mu_I = 1.28$ , corrected to  $\mu = 0.61$

$$T_c = 5.62 \times 10^7 \text{ K} = 4.49 \times 10^7 \text{ K}.$$

$$\text{now } P_g = \frac{k_B T \rho}{\mu m_u} = 2.2 \times 10^{16} \text{ barye}, \quad 3.67 \times 10^{16}.$$

$$\text{So } \beta = \frac{P_{\text{gas}}}{P} = \frac{2.2 \times 10^{16}}{4.2 \times 10^{16}} = 0.52, = 0.78.$$

Corrections are due to me forgetting it was a fully ionized gas.

$\mu^2 \rightarrow \mu^2 - \mu \left( -1 - \frac{1}{\mu} \right) \Delta \mu \rightarrow \mu^2 - \mu \Delta \mu$

$$\left( \begin{array}{c|c} \frac{p^2 + 1}{p^2} & \frac{1}{p^2} \\ \hline \frac{1}{p^2} & \frac{1}{p^2} \end{array} \right) = \frac{1}{p^2} \begin{pmatrix} p^2 + 1 & 1 \\ 1 & 1 \end{pmatrix}$$

$$25.4 = 100 \times C$$
$$P_{1/2} S \cdot S = 0, \quad P_{1/2} D S \cdot S = 0, \quad \text{both are 0}$$

$$210 \cdot 5 = 1050 \rightarrow 1050 = 2 \cdot 525 = 2 \cdot 3 \cdot 175 = 2 \cdot 3 \cdot 5 \cdot 35 = 2 \cdot 3 \cdot 5 \cdot 5 \cdot 7 = 2 \cdot 3 \cdot 5^2 \cdot 7$$

1. All the elements of the set are not equal to 0.
   
 2. All the elements of the set are equal to 0.

1)  $T_{\text{eff}} = T_{\text{ad}} = 2.7 \text{ K}$  and  $\mu_{\text{eff}} = 0$

$$J = \frac{1}{2} \int d^3x \left( \dot{\phi}^2 + (\nabla \phi)^2 + \frac{1}{2} m^2 \phi^2 \right)$$

$\ln(1 + \frac{1}{n}) = \frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} - \dots$

$$A^2 = 9A - A^3 = 1728 \cdot 2 = 3456$$

$$\text{any } \lambda \in \mathbb{R} \text{ and } \mu \in \mathbb{R} \text{ s.t. } \lambda + \mu = 1$$

$$5 \rightarrow 5 \text{ p.d.}, \quad 3 \rightarrow 3 \text{ p.d.}, \quad 1 \rightarrow 1 \text{ p.d.}$$

7mm A4

Q2 a) as before,

$$N_I = 1.28 \quad N_E = 1.165 \quad \text{so } N = (1.28^4 + 1.165^4)^{-1} = 0.61$$

from kin we have,

$$E_{pp} = 2.87 \times 10^4 \psi f_{II} g_{II} \rho X_i^2 T_q^{-2/3} e^{-3.381/T_q^{1/3}}$$

and

$$g_{II} = (1 + 3.82 T_q + 1.81 T_q^2 + 0.144 T_q^3 - 0.0114 T_q^4)$$

$$\text{where } T_q = T \times 10^{-9} \text{ K}^{-1} \quad \text{and } X_i = X_H = 0.715.$$

and for simplicity,  $\psi = 1$ ,  $f_{II} = 2$ .

and hydro equilibrium such that  $E_{nuc} \equiv L_{star}$ .

$$\text{so } E_{pp} = 5.14 \times 10^4 g_{II} \rho X_i^2 T_q^{-2/3} e^{-3.381/T_q^{1/3}}$$

This time we need to solve for  $\rho_c$   
to achieve this we calculate every thing in  $\rho_c$

So,  $\rho(\rho_c)$ ,  $P(\rho_c)$  and  $T(\rho_c)$ ,  
we obtain  $T$  from the EOS with radiation.

Once we have those quantities it is possible  
to calculate the total luminosity in  $\rho_c$  via,

$$L = \int_0^M E_{pp} dm \equiv \sum_i E_{pp}(\rho_c) \Delta m.$$

given that the star is in hydro static equilibrium.

Therefore by setting  $L \equiv L_\odot$  the suitable  
value for  $\rho_c$  was found to be

$$\rho_c \approx 50 \text{ g/cm}^3$$

The radius of this star is

$$R = 0.85 R_{\odot}$$

The main reason for this discrepancy might be the polytropic index used for this model. ( $n=1.5$ ) where as Main sequence stars are usually modelled with  $n=3$ . This has a significant effect on the  $\xi_1$  value that determines the radius of the star. Other potential reasons might be that we have neglected other forms/modes of energy generation that typically exists on the star.

26). Similar to part a) I computed the model for  $n=3$ ,  $M=10^8 M_\odot$  and use formula 18.65 in Kippenhahn's book, to calculate the energy production from the CNO cycle.

This time I solve for  $\rho_c$  from the EOS,

$$\text{where } P(\rho_c) = \frac{R \rho_c T_c}{\mu} + \frac{a}{3} T_c^4$$

to get,

$$\rho_c = [0.0033, 0.0065, 0.011, 0.018] \text{ g/cm}^3$$

now that  $\rho_c$  is defined for each central temperature the modes are fully defined and, I calculate the Radius and Luminosity to be,

$$R = [1317, 1053, 877, 782] R_{\odot}$$

$$L = [22, 2251, 79200, 1391000] L_{\odot}$$

Since the stars are assumed to be in hydrostatic equilibrium  $L$ , was calculated via,

$$L = \int_0^M \epsilon_{\text{CNO}} dm = \sum_{i=1}^N \epsilon_{\text{CNO}} \Delta m_i$$

Plots for  $T(n)$   $P(n)$  against ~~total~~ enclosed mass are supplied in the note book.

$\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   
 $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   
 $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   
 $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   
 $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$   $\frac{1}{2} \times 100 = 50$

2.  $\int_0^1 x^2 dx = \frac{1}{3}$

1.  $\frac{1}{2} \cdot \frac{2}{3} = \frac{1}{3}$

125

$$\text{range} \{S\} = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} = \mathbb{Z}_{10}$$

the number of cells in the population is 1000. The number of cells in the population is 1000.

$$1.25 \times 10^{20} \text{ m}^{-3} \times 1.6 \times 10^{-19} \text{ C} \times 120 \times 10^{-3} \text{ m} = 2.4 \text{ C}$$

$$\cos \theta = \cos \theta \quad \Rightarrow \quad \cos \theta = \cos \theta$$

1.  $\frac{1}{x^2} = x^{-2}$   $\frac{d}{dx} x^{-2} = -2x^{-3} = -\frac{2}{x^3}$

durch den 11. Jahrgang 2018

Q2 c)

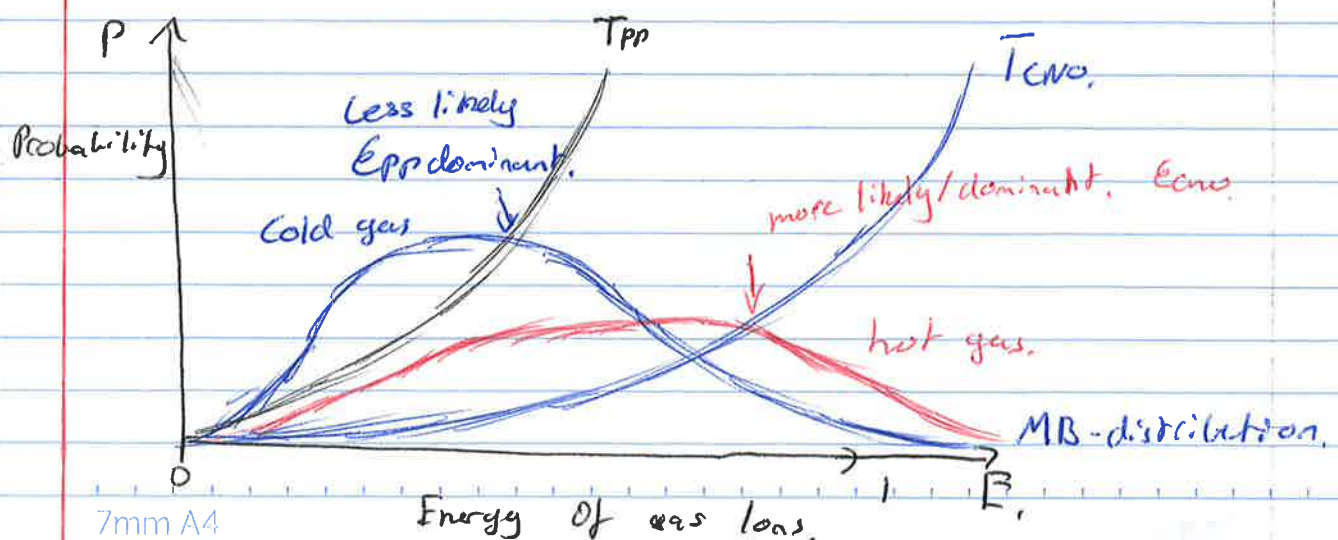

In the note book I plotted the energy generation of both the PP chain and CNO cycle for central densities of  $\rho_c = 80 \text{ g cm}^{-3}$  and  $\rho_c =$

as was found in Part a) and b). The temperature at which ~~the~~  $E_{pp}$  ~~dominates~~  $= E_{cno}$  is,  $T_c =$  and  $T_c =$  (from the plot).

Therefore the ~~energy~~ PP energy generation is ~~dominant~~ dominant for temperatures of  $T_c <$  and  $T_c <$   $\rightarrow$

The reason for this temperature sensitivity is due to the Coulomb barrier of the atoms involved in the process, specifically.

The CNO cycle works via proton capture of  $^{12}\text{C}$ ,  $^{13}\text{C}$  and  $^{14}\text{N}$  for which the Coulomb barrier is much higher than,  $^1\text{H}$ ,  $^2\text{H}$ ,  $^3\text{He}$ ,  $^7\text{Be}$ ,  $^7\text{Li}$ , that are involved in the pp-chain. One can also think of this problem in terms of the Gamow window where ions need more energy in order to overcome the Coulomb barrier.

~~Q2 c)~~

Q2 c) In order to find the necessary central temperature for which energy generation via the P-P chain dominates I calculated the total luminosity generated from the P-P chain and the CNO cycle. Although in part, a, b we only considered energy generation via one or the other in reality it is both. I.e.  $L_{\text{tot}} = L_{\text{CNO}} + L_{\text{pp}}$ . (However due to temperature sensitivity one form will usually dominate)

I then plot the luminosities and it is clear that for  $T_c < 2 \times 10^7$  K, pp energy is dominant.

Note! All plots are in the notebook, ~~with~~ along with the modules that was used in this assignment.
